

Delivery Momentum

A beginner's guide to reading the screen

1 · What this tool is for

Every day, huge numbers of shares trade on the NSE — but most of that activity is **intraday**: bought and sold within the same session, never actually owned. Only a portion is **delivered**, meaning it moves into the buyer's demat account and stays there.

This tool looks for stocks where **two things happened at once**:

- the price moved sharply over the last week or month, **and**
- a large amount of real delivery sat behind that move.

That pairing is the whole idea. A 10% jump on mostly intraday volume is often just traders passing stock back and forth. The same 10% jump on heavy delivery means somebody bought and *kept* it. The second is the more meaningful event.

In one line: it shows you where real money committed itself behind a price move — not where the price simply wiggled.

2 · The screen, top to bottom

1 Four dropdowns across the top

Window — how far back to measure (1 week to 1 month). **Min price move %** — ignore anything that moved less than this. **Direction** — gainers, losers, or both. **Rank by** — what to sort the list on.

2 "Filters" — click to expand

Quality controls that strip out junk: a minimum turnover and minimum share price remove thinly traded penny stocks that can top the list on one odd trade. The BE checkbox is explained in the glossary — leave it off unless you know you want it.

3 Four summary boxes

How many stocks passed your filters, the gainer/loser split, the total rupee delivery across all of them, and the median delivery percentage. A quick read on how broad the activity is.

4 The results table

One row per stock. Every column is defined in the glossary overleaf. The **Deliv %** column is drawn as a filled bar so you can scan down it quickly. You can download the whole list as a CSV with the button underneath.

5 The scatter chart

Each dot is one stock. **Left-to-right** is the price move — right of the centre line gained, left of it fell. **Up-and-down** is delivery value, so the highest dots are the biggest commitments. **Colour** is the surge: pale is normal, dark blue is unusual. Only the extremes are labelled; hover any dot for its details.

6 Day-by-day detail

Pick any stock to see its daily delivery bars next to its closing price. The dotted line marks where the window starts. **This is the most useful part of the page** — see section 5.

3 · Words you will meet

Term	What it means
Delivery	Shares that actually transferred into the buyer's account and were kept, rather than sold the same day.
Intraday churn	Buying and selling the same shares within one session. Creates volume, but no change of ownership.
Demat account	The electronic account where your shares are held.
Bhavcopy	The official file NSE publishes after each session with every stock's prices, volume and delivery. The only data this tool uses.
EQ	Normal trading. Almost every stock you'll care about is EQ, and the tool shows only these by default.
ETF	Exchange-traded fund. Automatically excluded: they generate enormous delivery and would crowd out actual companies.
Block / bulk deal	One large pre-arranged trade — a single holder moving a big stake at once.
Corporate action	A split, bonus issue or demerger. Changes the share price mechanically, without anything being bought or sold.
Lakh / crore	1 lakh = 100,000. 1 crore = 10,000,000. So ₹1 crore = ₹1,00,00,000.
Trading day	A day the market was open. Weekends and holidays don't count.
Window	The stretch of recent trading days being measured. "1 week" = the last 5 trading days.
Baseline	The trading days <i>before</i> the window. Used as "normal" so the window can be compared against it.

4 · The columns in the table

Column	What it means
Move %	Price change across the whole window — the last day's close against the price just before the window opened.
Deliv ₹cr	The rupee value of everything delivered during the window. This is the default ranking, because value is fairer than share count: 40 lakh shares of a ₹12 stock is a smaller commitment than 50,000 shares of a ₹3,000 one.

Deliv %	Delivered shares ÷ total shares traded. The conviction measure: high means buyers kept what they bought.
Surge x	How many times heavier this window's daily delivery is than the baseline's. 1.0 is business as usual; 3x means something changed. Blank means there's no baseline — usually a recent listing.
Deliv qty	The plain <i>count</i> of shares delivered, with no price attached.
Turnover ₹cr	Total value traded. A liquidity check, so thin stocks don't top the list on one unusual trade.
Close / Start	The price at the end of the window, and the price it started from.
Ser (Series)	NSE's segment code for the stock — see EQ and BE below.
BE	The "trade-to-trade" segment, usually for volatile or watch-listed stocks. Intraday trading isn't allowed, so delivery is 100% by rule — which makes Deliv % meaningless there. That's why it's switched off by default.

5 · Rules of thumb

■ Deliv % above 60	Strong. Most of what traded was actually kept.
■ Deliv % 25 - 60	Mixed. Normal for most active stocks.
■ Deliv % under 25	Mostly intraday churn. Treat the move sceptically.
■ Surge around 1x	Business as usual for that stock.
■ Surge 2 - 3x	Noticeably busier than normal. Worth a look.
■ Surge above 5x	Something specific happened. Find out what before drawing conclusions.

6 · Four things to try

Start with the defaults

1 week, 5% minimum move, ranked by delivery value. That's the "big money" view — the largest rupee commitments behind sharp moves. Mostly large, familiar names.

Then change "Rank by" to Delivery surge

This is where the discoveries are. Ranking by value keeps re-finding the same large companies; ranking by surge finds stocks whose *behaviour changed*, at any size.

Set Direction to "Losers only" and look for high delivery

A falling price with heavy delivery means someone was buying what everyone else was selling — accumulation into weakness. Often more interesting than a crowded rally.

Always open the day-by-day detail before believing a row

This is the step that separates a real trend from a one-off. The summary table cannot tell you the difference; the daily chart can. Two genuine examples:

KOTAKBANK	daily delivery ₹cr:	433	232	520	947	606
	→ steady buying every session,	68% delivery, 1.7× surge				
FMGOETZE	daily delivery ₹cr:	1	66	51	13	144
	→ isolated spikes,	8% delivery, 36× surge				

FMGOETZE's 36× surge looks dramatic in the table, but the delivery arrived in disconnected bursts on a low delivery percentage — an event, not a trend. Kotak's is spread evenly across every session. **Same tool, opposite conclusions.**

7 · Three traps to know about

A huge fall may not be a fall at all. A stock that splits 10-for-1 shows up as roughly −90%, because the raw exchange data isn't adjusted for corporate actions. A real example from live data: a stock priced at ₹1,043.60 appeared the next session at ₹104.45 — a 10:1 split, not a crash. If you see roughly −50%, −80% or −90%, check the price chart: a corporate action shows one clean vertical drop, while a genuine decline slides down over several days.

A very high surge is often one large deal. A big surge combined with a very high delivery percentage frequently means a single block or bulk deal — one shareholder moving a stake in one print. That is one party's decision, not broad accumulation by many buyers. Check the news before reading it as a trend.

The surge figure weakens at the widest window. Surge compares the window against the days before it, and the tool holds 30 trading days in total. A 1-week window leaves 25 days of baseline; a 1-month window leaves only 10. Trust surge less at the widest setting.

8 · Where the numbers come from

Everything on the page comes from NSE's official end-of-day *Security-wise Price, Volume and Deliverable Position* file. A scheduled job downloads it after the close each trading day, strips out ETFs, and saves a rolling 30-day snapshot that the page reads. Nothing is estimated and nothing is live — figures update once per day, after the market closes.

Information only — not investment advice. Source: NSE daily bhavcopy. Delivery figures are published after the close and are not available intraday.
